

Product Description Final

Directions:

From group work in class, you should have a draft product name, primary user, problem statement, product vision, what is in scope and out of scope, a north star metric and supporting metrics.

Product Name:

“Second Brain” – Challenging Human Reasoning

Primary User(s):

University students seeking to improve academic rigor and critical thinking.

Problem Statement:

University students are increasingly vulnerable to confirmation bias and illogical reasoning. This is exacerbated by social media algorithms that prioritize engagement over accuracy and generative AI that defaults to validating user assumptions with "agreeable" answers. Consequently, students lack a rigorous intellectual "sparring partner" to stress-test their arguments, leading to shallow work and fragile conclusions. Students need a technology assistant that intentionally pushes back, identifies logical fallacies, and constructs strong opposing arguments to improve the quality of their critical thinking and final output.

Product Vision:

To empower students to improve their own logical processes and produce more thoughtful, academically rigorous work. By reviewing student-created material and providing accurate opposition, the product transforms the writing process from a vacuum of self-validation into an active debate, ultimately helping students contribute more meaningfully to society.

In Scope

Needs to...

- Single User
- Interface for writing
- Chat bot interface for real-time checking, feedback, and responding

Out of Scope

- Multi-User
- Checking grammar
- Checking spelling
- Affirm user's position

Success for the User

The student can see feedback directly on their document , successfully identifies a bias they previously held , and actively alters their content, either by revising their conclusion or strengthening their rebuttal, based on the AI's opposition.

Success for the Product

The product achieves its North Star Metric of 10+ hours of weekly active use and maintains a satisfaction rating of 4+ stars, indicating that users find the "friction" of being challenged valuable rather than frustrating.

North Star Metric

Weekly time spent in the application (Target: 10+ hours). High usage indicates that the tool has become a core part of the student's research and writing workflow.

Supporting Metrics

- Average post-session rating (Target: 4/5 stars). This measures if the specific "sparring" session was effective in helping the student think more deeply.
- The percentage of AI-generated "opposition" points that result in a user modifying their original document
